F.Stenger. Summary of Sinc numerical methods. J.Comp.Appl.Math., v.121 (2000) pp. 379-420.

$$u'_t + Au = f(t), \quad t \in [0, T]$$

$$u(0) + \sum_{k=1}^m \alpha_k u(t_k) = u_0, \quad 0 < t_1 < t_2 < \ldots < t_m \le T,$$
 (1)

where $\alpha_k \in \mathbb{R}$, $k = \overline{1, m}$, f(t) is a given vector-valued function with values in Banach space X, $u_0 \in X$. The operator A with the domain D(A) in a Banach space X is assumed to be a densely defined strongly positive (sectorial) operator, i.e. its spectrum $\Sigma(A)$ lies in a sector of the right half-plane with the vertex at the origin and and the resolvent decays inversely proportional to |z| at the infinity.

Additionally outside the sector and on its boundary Γ_Σ the following estimate for the resolvent holds true

$$\|(zI - A)^{-1}\| \le \frac{M}{1 + |z|}.$$
 (2)

The numbers ρ_0 , φ are called the spectral characteristics of A. The hyperbola

$$\Gamma_0 = \{ z(\xi) = \rho_0 \cosh \xi - ib_0 \sinh \xi : \xi \in (-\infty, \infty), \ b_0 = \rho_0 \tan \varphi \}$$
(3)

in turn is referred as a spectral hyperbola. It has a vertex at $(\rho_0, 0)$ and asymptotes which are parallel to the rays of the spectral angle Σ .

In works of Byszewski it was proven that the solution of the problem (1) exists and is unique provided that one of the following two conditions is fulfilled:

$$\sum_{i=1}^{m} |\alpha_i| < 1, \tag{4}$$

or

$$\sum_{i=1}^{m} |\alpha_i| e^{-\rho_0 t_i} < 1,$$
(5)

with ρ_0 – spectral characteristic.

The solution of (1) is in the form $u(t) = u_h(t) + u_{ih}(t)$, where $u_h(t) = e^{-At}B^{-1}u_0$ is the solution of the homogeneous problem with the initial condition u_0 and

$$u_{ih}(t) = -e^{-At}B^{-1}\sum_{i=1}^{m} \alpha_i \int_0^{t_i} e^{-A(t_i-\tau)}f(\tau)d\tau + \int_0^t e^{-A(t-\tau)}f(\tau)d\tau$$
(6)

is the solution of the inhomogeneous problem with zero initial condition and

$$B(A) = I + \sum_{i=1}^{m} \alpha_i \mathrm{e}^{-At_i}$$

(日) (同) (王) (王) (王)

First of all we consider the solution $u_h(t) = e^{-At}B^{-1}(A)u_0$ of homogeneous problem (1). Our aim in this section is to construct an exponentially convergent method for its approximation. Using the Dunford-Cauchy representation of $u_h(t)$ we obtain

$$u_{h}(t) = \frac{1}{2\pi i} \int_{\Gamma_{I}} e^{-zt} B^{-1}(z) (zI - A)^{-1} u_{0} dz$$

= $\frac{1}{2\pi i} \int_{\Gamma_{I}} \frac{e^{-zt}}{1 + \sum_{i=1}^{n} \alpha_{i} e^{-zt_{i}}} (zI - A)^{-1} u_{0} dz.$ (7)

Representation (7) makes sense only when the function $e^{-zt}B^{-1}(z)$ is analytic in the region enveloped by Γ_I . Condition (4) or (5) guaranty this analyticity.

10 / 29

Parameterizing the integral (7) we get

$$u_h(t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} \mathcal{F}(t,\xi) d\xi, \qquad (8)$$

with

$$\mathcal{F}(t,\xi) = F_A(t,\xi)u_0,$$

$$F_A(t,\xi) = \frac{e^{-z(\xi)t}z'(\xi)}{1 + \sum_{i=1}^n \alpha_i e^{-z(\xi)t_i}} \left[(z(\xi)I - A)^{-1} - \frac{1}{z(\xi)}I \right],$$

$$z'(\xi) = a_I \sinh \xi - ib_I \cosh \xi.$$

æ

We approximate integral (8) by the following Sinc-quadrature (F.Stenger (1993). Numerical methods based on Sinc and analytic functions. Springer Verlag. New York, Berlin, Heidelberg.):

$$u_{h,N}(t) = \frac{h}{2\pi i} \sum_{k=-N}^{N} \mathcal{F}(t, z(kh)), \qquad (9)$$

2 \ \ \ \ \

with an error

$$\|\eta_N(\mathcal{F},h)\| = \|u_h(t) - u_{h,N}(t)\|$$

$$\leq \frac{c\|A^{\alpha}u_0\|}{\alpha} \left\{ \frac{e^{-\pi d_1/h}}{\sinh(\pi d_1/h)} + \exp[-a_I t \cosh((N+1)h) - \alpha(N+1)h] \right\},$$

where the constant *c* does not depend on *h*, *N*, *t*. Equalizing the both exponentials for t = 0 implies

$$\frac{2\pi d_1}{h} = \alpha (N+1)h,$$

or after the transformation

V.B. Vasylyk ()

12 / 29

$$h = \sqrt{\frac{2\pi d_1}{\alpha(N+1)}}.$$
(10)

With this step-size the following error estimate holds true

$$\|\eta_{N}(\mathcal{F},h)\| \leq \frac{c}{\alpha} \exp\left(-\sqrt{\frac{\pi d_{1}\alpha}{2}(N+1)}\right) \|A^{\alpha}u_{0}\|, \qquad (11)$$

with a constant *c* independent of *t*, *N*. In the case t > 0 the first summand int the argument of $\exp[-a_l t \cosh((N+1)h) - \alpha(N+1)h]$ from the estimate for $||\eta_N(\mathcal{F}, h)||$ contributes mainly to the error order. Setting in this case $h = c_1 \ln N/N$ with some positive constant c_1 we remain, asymptotically for a fixed *t*, with an error

$$\|\eta_{N}(\mathcal{F},h)\| \leq c \left[e^{-\pi d_{1}N/(c_{1}\ln N)} + e^{-c_{1}a_{I}tN/2 - c_{1}\alpha\ln N} \right] \|A^{\alpha}u_{0}\|, \quad (12)$$

Thus, we have proved the following result.

Theorem (1)

Let A be a densely defined strongly positive operator and $u_0 \in D(A^{\alpha})$, $\alpha \in (0, 1)$, then Sinc-quadrature (9) represents an approximate solution of the homogeneous nonlocal value problem (1) (i.e. the case when $f(t) \equiv 0$) and possesses a uniform with respect to $t \ge 0$ exponential convergence rate which is of the order $\mathcal{O}(e^{-c\sqrt{N}})$ uniformly in $t \ge 0$ provided that $h = \mathcal{O}(1/\sqrt{N})$ (estimate (11)) and of the order $\mathcal{O}(\max \{e^{-\pi dN/(c_1 \ln N)}, e^{-c_1 a_l tN/2 - c_1 \alpha \ln N}\})$ for each fixed t > 0 provided that $h = c_1 \ln N/N$ (estimate (12)).

14 / 29

In this section we consider the particular solution (6) of inhomogeneous problem (1), i.e. with $f(t) \neq 0$. Let us rewrite formula (6) in the form

$$u_{ih}(t) = u_{1,ih}(t) + u_{2,ih}(t),$$
 (13)

with

$$u_{1,ih}(t) = \int_0^t e^{-A(t-\tau)} f(\tau) d\tau, \quad u_{2,ih}(t) = -\sum_{j=1}^m \alpha_j u_{2,ih,j}(t), \quad (14)$$

where

$$u_{2,ih,j}(t) = \int_0^{t_i} B^{-1} e^{-A(t+t_i-\tau)} f(\tau) d\tau.$$
 (15)

3

(人間) ト く ヨ ト く ヨ ト

We approximate the term $u_{1,ih}(t)$ by the algorithm:

$$u_{1,ih}(t) \approx u_{1,N}(t) = \frac{h}{2\pi i} \sum_{k=-N}^{N} z'(kh) [(z(kh)I - A)^{-1} - \frac{1}{z(kh)}I] \times h \sum_{p=-N}^{N} \mu_{k,p}(t) f(\omega_p(t)),$$
(16)

where

$$\mu_{k,p}(t) = \frac{t}{2} \exp\{-\frac{t}{2}z(kh)[1 - \tanh(ph)]\}/\cosh^2(ph),$$
$$\omega_p(t) = \frac{t}{2}[1 + \tanh(ph)], \ h = \mathcal{O}\left(1/\sqrt{N}\right),$$
$$z(\xi) = a_I \cosh\xi - ib_I \sinh\xi, \ z'(\xi) = a_I \sinh\xi - ib_I \cosh\xi.$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

16 / 29

- B

The next theorem characterizes the error of this algorithm [].

Theorem ((2), Gavrilyuk, Makarov)

Let A be a densely defined strongly positive operator with spectral characteristics ρ_0 , φ and a right hand side $f(t) \in D(A^{\alpha})$, $\alpha > 0$ for $t \in [0, \infty]$ can be analytically extended into the sector $\Sigma_f = \{\rho e^{i\theta_1}: \rho \in [0, \infty], |\theta_1| < \varphi\}$ where the estimate

$$\|A^{\alpha}f(w)\| \le c_{\alpha}e^{-\delta_{\alpha}|Re|w|}, \ w \in \Sigma_{f}$$
(17)

with $\delta_{\alpha} \in (0, \sqrt{2}\rho_0]$ holds, then algorithm (16) converges to the solution of (1) with the error estimate

$$\|\mathcal{E}_{N}(t)\| = \|u_{1,ih}(t) - u_{1,N}(t)\| \le c e^{-c_{1}\sqrt{N}}$$
 (18)

uniformly in t with positive constants c, c_1 depending on α , φ , ρ_0 and independent of N.

3

- 4 同 6 4 日 6 4 日 6

We propose the following algorithm to compute an approximation $u_{2,j,\mathsf{N}}$ to $u_{2,i\mathsf{h},j}$

$$u_{2,ih,j}(t) \approx u_{2,j,N}(t) = \frac{h}{2\pi i} \sum_{k=-N}^{N} e^{-z(kh)t} z'(kh) B^{-1}(z(kh)) \\ \times \left[(z(kh)I - A)^{-1} - \frac{1}{z(kh)}I \right] h \sum_{p=-N}^{N} \mu_{k,p,j} f(\omega_{p,j}).$$
(19)

▲ 同 ▶ → ● 三

э

Theorem (3)

Let the assumptions of the theorem 2 hold. Then algorithm (19) converges uniformly with respect to t and moreover the following error estimate holds true:

$$\|\mathcal{E}_{N}(t)\| = \|u_{2,ih,j}(t) - u_{2,j,N}(t)\| \le c e^{-c_{1}\sqrt{N}},$$
 (20)

with positive constants c, c_1 depend on α , φ , ρ_0 and independent of N.

Theorem 3 guaranties that the error this approach will be bounded by:

$$\|u_{2,ih}(t) - u_{2,N}(t)\| \le \sum_{j=1}^{m} c e^{-c_1 \sqrt{N}} \le c_2 e^{-c_1 \sqrt{N}}.$$
 (21)

Thus, the approximations (9) together with (16) represent an exponentially convergent algorithm for the problem (1).

We consider the homogeneous problem (1) with the operator A defined by

$$D(A) = \{u(x) \in H^2(0,1) : u(0) = u(1) = 0\},\$$

$$Au = -u''(x) \ \forall u \in D(A).$$
(22)

The initial nonlocal condition reads as follows:

$$u(x,0) + 0.5u(x,0.2) + 0.3u(x,0.4)$$

$$= (1 + 0.5\mathrm{e}^{-\pi^2 0.2} + 0.3\mathrm{e}^{-\pi^2 0.4})\sin(\pi x),$$

with $u_0 = (1 + 0.5e^{-\pi^2 0.2} + 0.3e^{-\pi^2 0.4}) \sin(\pi x) \in D(A)$. The exact solution of the problem is $u(x, t) = e^{-\pi^2 t} \sin(\pi x)$.

21 / 29

It is easy to find that

$$(zI - A)^{-1}u_0 = \left(z + \frac{d^2}{dx^2}\right)^{-1}\sin(\pi x) = \frac{\sin(\pi x)}{z - \pi^2}.$$

Due to Theorem 1 the error should not be greater then $\varepsilon_N = \mathcal{O}\left(e^{-c\sqrt{N}}\right)$. The constant *c* in the exponent can be estimated using the following a-posteriori relation:

$$c = \ln\left(\frac{\varepsilon_N}{\varepsilon_{2N}}\right)(\sqrt{2}-1)^{-1}N^{-1/2} = \ln(\mu_N)(\sqrt{2}-1)^{-1}N^{-1/2}$$

The numerical results are presented in the Table 2 for this estimation show that the constant can be estimated as $c \approx 1.5$ when $N \rightarrow \infty$.

Table: The estimate of c

The next example deals again with a homogeneous problem but in this more realistic case the resolvent of A on the element u_0 can't be calculated analytically.

We consider the homogeneous problem (1) with the operator A defined as in (22) and with the following initial nonlocal condition:

$$u(x,0) + u(x,0.5) = x \ln(x),$$

where $u_0 = x \ln(x) \in A^{\alpha}$, $\alpha < 1/2$. In this case the resolvent can be represented using the Green function

$$(zI - A)^{-1}u_0 = \left(z + \frac{d^2}{dx^2}\right)^{-1} x \ln(x) = \int_0^1 G(x, s) s \ln(s) ds,$$

$$G(x, s) = -\frac{1}{\sqrt{z} \sin(\sqrt{z})} \begin{cases} \sin(x\sqrt{z}) \sin((1 - s)\sqrt{z}) & x \le s, \\ \sin(s\sqrt{z}) \sin((1 - x)\sqrt{z}) & x \ge s \end{cases},$$

where the integrals were computed by exponentially convergent Sinc-quadrature.

Table: Values of the solution u(x, t) for x = 0.5, t = 0.3.

It can be easily seen that the number of stabilized digits increases according to the theoretical prediction by Theorem 1.

Let us consider the inhomogeneous problem (1) with the same A defined by (22), and the nonlocal condition

$$u(x,0) + 0.5u(x,0.2) = (1 + 0.5e^{0.2})\sin(\pi x),$$

For f(t, x) at the right hand side of the equation (1) we set

$$f(x,t) = (1+\pi^2)e^t \sin(\pi x).$$

The exact solution of the problem is $u(x, t) = e^t \sin(\pi x)$. We have used the algorithm defined by (9), (16).

The results presented in Table 4 and are again in good agreement with the theoretical predictions.
